EXAMINER

HAILEY, PATRICIA L

ART UNIT	PAPER NUMBER
----------	--------------

1755

DATE MAILED: 02/01/2005

Please find below and/or attached an Office communication concerning this application or proceeding.

Applicants' Preliminary Amendment, filed on December 9, 2003, has been made of record and entered. In the amendment, claims 24-46 have been canceled; no new claims have been added.

Claims 1-23 remain pending in this application.

Double Patenting

1. The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

2. Claims 1-3 and 6-16 are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 1-18 of U.S. Patent No. 6,660,680.

Although the conflicting claims are not identical, they are not patentably distinct from each other because both the claims in the instant application and in the patent are directed to a powder batch comprising electrocatalyst particles

comprising a support phase and an active species phase (e.g., instant claim 1). However, Patent Claims 1 and 14 recite that the “active species phase” is a *metal oxide* active species phase, which is also recited in instant claim 6. A comparison of the respective sets of claims exhibits overlapping ranges of (1) the average particle size for the support phase, (2) the cluster size of the active species phase, and (3) the surface area of the electrocatalyst particles.

The subject matter as a whole would have been obvious to one having ordinary skill in the art at the time the invention was made to have selected the overlapping portion of the range disclosed by the reference because overlapping ranges have been held to be a prima facie case of obviousness. In re Malagari, 182 U.S.P.Q. 549.

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.

2. Ascertaining the differences between the prior art and the claims at issue.
 3. Resolving the level of ordinary skill in the pertinent art.
 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.
5. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).
6. *Claims 1-5 and 9-23 are rejected under 35 U.S.C. 103(a) as being unpatentable over Itoh et al. (U. S. Patent No. 5,876,867).*

Itoh et al. teach electrocatalyst particles comprising platinum or an alloy thereof (considered to read upon the phrase "active species phase") supported on a conductive carbon powder (considered to read upon the phrase "support phase"). See col. 2, lines 52-61 of Itoh et al.

The platinum (or platinum alloy) may be supported on the conductive carbon carrier in an amount of 1% to 60% by weight, based on the whole catalyst. See col. 3, line 63 to col. 4, line 5 of Itoh et al.

The conductive carbon powder may be any conductive carbon powder known as carriers for electrocatalysts. As an example, carbon black powders having a BET surface area of from 50 to 1500 m²/g and a graphite crystallite diameter of from 7 to 80 Å (0.7 to 8 nm) may be used. See col. 4, lines 16-41 of Itoh et al. While Itoh et al. do not specifically teach the claimed average size of the “primary support particles” of “about 10 to about 100 nanometers” as recited in claim 1 (or “about 20 to about 40 nanometers”, i.e., claim 17), one of ordinary skill in the art would expect that a difference of, for example, 20 Å is miniscule, especially when Itoh et al. clearly state that **any conductive carbon powder** known as carriers for electrocatalysts are suitable for Patentees’ electrocatalyst. Further, it would have been obvious to one of ordinary skill in the art to select a conductive carbon carrier having the claimed particle size, since it has been held to be within the general skill of a worker in the art to select a material on the basis of its suitability for the intended use as a matter of obvious design choice. In re Leshin, 125 U.S.P.Q 416.

The platinum (or platinum alloy) has no particular limitations on the characteristics of crystallite diameter or surface area. However, preferable ranges are 15-100 Å and 30-200 m²/g, respectively. See col. 7, lines 54-67 of Itoh et al.

Itoh et al. do not teach the specifically claimed ranges of, for example, the particle sizes of the “support phase” and “active species phase”. However, the reference teaches values for these (and other) characteristics that overlap those respectively claimed. The subject matter as a whole would have been obvious to one

having ordinary skill in the art at the time the invention was made to have selected the overlapping portion of the range disclosed by the reference because overlapping ranges have been held to be a prima facie case of obviousness. In re Malagari, 182 U.S.P.Q. 549.

Conclusion

7. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Patricia L. Hailey whose telephone number is (571) 272-1369. The examiner can normally be reached on Mondays-Thursdays.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Mark L. Bell can be reached on (571) 272-1362. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the Group 1700 Receptionist, whose telephone number is (571) 272-1700.
